Provisional Patent Application of

Buddie Gordon Miller for

TITLE: SLOTTED HULL

CROSS REFERENCE TO RELATED APPLICATIONS	Not Applicable
FEDERALLY SPONSORED RESEARCH	Not Applicable
SEQUENCE LISTING OR PROGRAM	Not Applicable
BACKGROUND OF INVENTION – Field of Invention	
This invention relates to the hulls of boats.	
BACKGROUND OF INVENTION	
This invention sets out to improve the disposition of the hulls in boats, yachts and ships all of which may be propelled by a variety of means including but not limited to rowing, pedaling, sails, mechanical engines, electric motors, towing, etc. These vessels have one or more hulls, one or more of which rests partially submerged at the surface of the water. It is also applicable to submarine vessels which operate either fully or partially submerged. For the purposes of this Application, the term "boat" shall be construed to include all and any of the above, and in any combinations thereof.	

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

BACKGROUND OF INVENTION *contd*

The hull of a boat is generally designed to be laterally symmetrical and the weight-loadings of and in the boat are generally disposed so that the hull of the boat rests in balanced laterally symmetrical aspect on the water.

The submerged portion of the hull will generally be of roughly triangular or of inverted arctuate segment, in shape. In some instances the bottom of the hull may be essentially flat, yielding a rectangular submerged section, or may incorporate compound shapes.

In the majority of these instances, the hull will displace a body of water that is essentially symmetrical in lateral cross-section and thereby yields a Centre of Buoyancy (COB) that acts through the longitudinal centre-line of the hull. A consequence of this disposition of COB is that the boat has a tendency to rotate or see-saw (roll) about the virtual pivot-point of the COB. This tendency is exacerbated with increasing distance of separation of the Centre of Gravity (CG) of the boat, either above or below, from the COB.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

The result of this interaction of forces is a hull that rolls (side-to-side) and/or pitches (front-to-back) under the influences of waves, wind and/or movement of people or other loads within the hull. Significant rolling or pitching of a boat directly reduce the stability of the boat, compromise its safe operation, and detract from the comfort and well-being of the occupants.

Traditional methods for inhibiting the rolling/pitching actions of boats include: -

- Extended keels under the hull: These bring the penalties of a) increased weight; b) increased wetted-surface/drag; c) increased structural demands on the hull; d) increased power-consumption; e) increased draft.
- Weighty Ballast internal or external to the hull: This comes with the penalties of a) increased weight; b) increased wetted-surface/drag; c) increased structural demands on the hull; d) increased power-consumption; e) increased draft; f) increased articulating mechanisms - in the case of moveable ballast.
- Stabilizing Sails: These require a mast and its associated rigging.
- Multihulls – the rigid juxtaposition of additional hull(s) parallel to the primary hull: These introduce the penalties of a) substantially increasing the beam

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

(width) of the boat with consequent limitations in docking space requirement; overland road transportability; accessibility to travel-lifts common at boat marinas. Multihulls also have the limitation of not being aesthetically favoured by the majority of boaters. The most significant limitation of multi-hulls is the extreme difficulty in righting once overturned and moreso if it is a sailboat with mast and sails attached.

- Fixed and/or articulating stabilizer mechanisms: These generally include external appendages which are vulnerable to collision damage. They also introduce additional mechanical systems with attendant demands for installation, operation and maintenance. Included among these systems are gyroscopic-based mechanisms. It is clear that an elegant solution to the problems of rolling/pitching of boats would surmount or circumstep the limitations of the above-listed systems.

BACKGROUND OF THE INVENTION – Objects and Advantages.

Accordingly, several objects and advantages of the disclosed Slotted Hull invention are: to provide a boat hull which significantly reduces the rolling-action and/or the pitching-action to which traditional boat hulls are susceptible, and further:

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

- a) to provide a boat hull of significantly enhanced inherent stability over traditional boat hulls;
- b) to provide a boat hull that will be safer in use and operation than traditional boat hulls;
- c) to provide a boat hull which will accord a significantly increased level of comfort and well-being to its occupants.
- d) to provide a boat hull which retains favoured aesthetics while providing the substantial benefits of enhanced stability, enhanced safety and enhanced comfort.
- e) to provide a boat hull with the enhancing benefits listed to d) above, without the introduction of substantial additional weight to the hull.
- f) to provide a boat hull with the enhancing benefits listed to d) above, without significant increase to the power-requirements for propelling the hull.
- g) to provide a boat hull with the enhancing benefits listed to d) above, without any significant increase to the draft of the hull.
- h) to provide a boat hull with the enhancing benefits listed to d) above, without significant increase to the wetted-surface/drag of the hull.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

- i) to provide a boat hull which delivers the enhancing benefits listed to d) above, for which benefits, the enabling structure enhances the inherent strength, stiffness and integrity of the basic hull.
- j) to provide a boat hull which delivers the enhancing benefits listed to d) above in entirely passive manner, without the introduction of any articulating mechanical or powered devices.
- k) to provide a boat hull which delivers the enhancing benefits listed to d) above, without requiring appendages external to the hull.
- l) to provide a boat hull which delivers the enhancing benefits listed to d) above, without any requirement for alteration of the basic external dimensions of the boat/hull.
- m) to provide a boat hull which delivers the enhancing benefits listed to d) above and which is adaptable to most, and possibly all, common hull configurations.
- n) to provide a boat hull which delivers the enhancing benefits listed to d) above and is easy and uncomplicated to manufacture.
- o) to provide a boat hull which delivers the enhancing benefits listed to d) above and which may readily be manufactured using any of the common boat-building materials

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

- p) to provide a boat hull which delivers the enhancing benefits listed to d) above without substantial increase in construction cost; and possibly with reduced construction cost versus alternative systems of stabilization.
- q) to provide a boat hull which delivers the enhancing benefits listed to d) above and which would require no new skills or techniques for its operation and use; and which, by its reduction in user/operator fatigue, would enhance the comfort and well-being of its occupants.
- r) to provide a boat hull which delivers the enhancing benefits listed to d) above, and which would satisfy the requirements of the various regulatory/certifying agencies.

Still further objects and advantages will become apparent from a consideration of the ensuing description and drawings.

SUMMARY

The disclosed Slotted Hull invention engineers the vertical separation of the water displaced under a boat hull, into two or more effectively disparate bodies of water. Each separate body of water then generates its own Centre of Buoyancy (COB) acting

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

under the hull at a designed distance from the COB of any other body of water. This separation of Centres of Buoyancy establishes two or more "feet" for the hull to "stand" on in the water rather than the conventional situation of a unit-body hull balancing see-saw fashion on a single, central pivot-point.

This separation of COB's is achieved through the introduction of relatively narrow vertical slot(s) running through the hull of the boat at and below its waterline. The resulting "multi-footed" hull would be subject to significantly less rolling/pitching action; would be more stable on the water; would be safer in use and operation; and would enhance the comfort and well-being of its occupants.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

DETAILED DESCRIPTION

The hull of a typical boat presents a single Centre-of-Gravity (CG) to the supporting water, this CG conventionally falling somewhere along the longitudinal centre-line of the hull.

The hull displaces a single coherent body of water which exerts an upthrust on the hull, this upthrust being effectively centered at its Centre of Buoyancy (COB). The COB acts at the CG of the body of displaced water which is not necessarily coincident with the CG of the boat either vertically or longitudinally.

Subject to the action of wind and/or waves and/or movement of loads within the boat, the single COB provides a single virtual pivot-point about which the hull of the boat tends to rotate in see-saw fashion. This rolling (side-to-side) and/or pitching (fore-and-aft) action: a) serves to limit the stability of the boat; b) limits the safe operation of the boat, and c) limits the comfort and well-being of the occupants of the boat.

It must be noted that rolling and/or pitching as described above are generally responses to dynamic stimuli, whereas stability may be seen as the tendency to resist

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

rotational responses to shifting internal loads even in conditions of complete external calm.

The subject Slotted Hull invention alleviates the foregoing limitations by the introduction of vertical, relatively narrow slot(s) running through the hull of a boat and intersecting the water-line of the hull in all situations of operation and/or loading. The effect of these slot(s) is to vertically separate the body of water displaced by the hull into two or more effectively separate and distinct bodies, each body then exerting its own "body-of-buoyancy" and so its own COB to the hull.

Since the "effective" Centre of Gravity of a boat is not of itself a concentration of the actual weights distributed about the boat, a separation of the supporting water into different "bodies-of-buoyancy" would induce separation of the weight of the boat into different Centres-of-Gravity commensurate with the geometric footprints of the "bodies-of-buoyancy". This effective separation of COB's and of CG's would have the effect of providing the boat hull with a multiplicity of "feet" on which to stand in

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

the water, rather than the conventional single pivot-point (COB) around which to rotate/see-saw.

Fig 1 illustrates a transverse section of a basic typical boat hull with a single vertical slot 23 running lengthwise along the centre-line of the hull. This slot 23 may be seen to separate the supporting water into two separate and distinct bodies of water, each separate body thus generating its own Centre of Buoyancy (COB) 21. As may be seen, the slot top edge 27 is closed along its length while the slot bottom edge 25 is open along its length.

Fig 2 illustrates a transverse section of the two separate bodies of displaced water 29 which are created by the slotted hull of Fig 1. The two created COB's 21 may be seen to be laterally distanced from each other. This separation of the supporting water into two separate and distinct COB's 21 induces into the hull commensurate separation of the boat weight into two separate Centers of Gravity also laterally distanced from each other. The combined effect of these separations is to generate two virtual "feet" on which the hull "stands" in the water. There is some similarity in this effect to the principle of the catamaran which employs two separate and distinct

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

hulls to generate two separate and laterally distanced centers-of-buoyancy. The boat of this invention however generates a similar effect within the envelope of a single integral hull.

Fig 3 shows a transverse section of a typical boat hull with a multiplicity of vertical slots 23 running along the length of the hull. Differing from the embodiment of Fig 1, in this embodiment the slot bottom edges 25 are closed thus preserving the integrity of the outer plating of the hull and greatly enhancing the inherent strength of the hull structure. The slots 23 penetrate the hull plating only at the very slot fore-end 31 and at the very slot aft-end 33 (31 and 33 may be seen at Fig 7).

Fig 4 shows a transverse section of the body of displaced water 29 generated by the hull of Fig 3. Apparent here is the multiplicity of COB's 21 generated, spaced each from the other. The lateral stability imparted by this configuration may be likened to that of a basic log-raft.

Fig 5 shows a lateral section of a typical submarine vessel also incorporating a relatively narrow vertical slot 23 running lengthwise along its centre-line. In keeping with the principle of this invention, the slot 23 effectively separates the water displaced by the hull into two effectively separate bodies and so generates two

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

separate and laterally distanced COB's 21. These distanced COB's 21 replace the single, centrally positioned COB of conventional hulls around which the hull would tend to rotate. This results in a more laterally stable hull with less requirement for powered, dynamic stabilizers common to submarine vessels. Alternative embodiments of the slot placement illustrated in Fig 5 could have the slot 23 centered vertically in the hull or positioned more in the upper half of the hull section.

Fig 6 shows a side view of a configuration of slot 23 wherein the slot bottom edge 25 is engineered to be as low as is practicable along the middle portion of the slot 23 in order to maximize the separation of the bodies of water displaced. The slot 23 however is fabricated with a fore-slope 28 approaching the slot fore-end 31, and with an aft-slope 30 approaching the slot aft-end 33. These sloped sections are intended to minimize the vertical height of the slot 23 at its fore-end 31 and aft-end 33 and by the reduction in size of these openings to the hull, so enhance the structural strength and integrity of the hull in these areas.

The bottom lips 32 and 34 of these reduced openings should be engineered to lie somewhat below the hull water-line in its least loaded (lightship) condition.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

Illustrated in Fig 7 is a side view of a typical boat with a single vertical slot 23 open both at its fore-end 31 and its aft-end 33. Fig 8 shows a front view of the boat of Fig 7 and illustrates the two COB's 21 generated by the slot 23. Fig 9 shows a lateral section of the boat of Fig 7 and illustrates the slot-trunk 35 which is fabricated to create the slot 23. Illustrated at Fig 10 is a plan view of the boat of Fig 7.

Illustrated in Fig 11 is a transverse section of a typical sailboat with a fixed-keel 37. Shown is the vertical slot 23 extending some way vertically down through the fixed-keel 37. Also shown is the fabricated slot-trunk 35 which extends the slot 23 vertically upward to a point at or above the anticipated operating water-line of the hull.

Fig 12 shows an underside view of a typical boat hull with a single vertical slot 23 running along the centre of the hull. In this embodiment the bottom edge of the slot 23 is intermittently closed by keel-strips 39 alternating with keel-openings 41. This embodiment is intended to principally preserve the structural strength of the hull

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

while at the same time permitting practical access to the interior of the slot 23 for the manual or mechanical cleaning of any marine growth accumulating therein.

Fig 13 shows an underside view of a typical boat hull incorporating both a longitudinal and an angled transverse slot 23. In this embodiment the supporting water would be separated into four different "bodies-of-buoyancy" each one generating its own COB 21. This four-legged stance would serve to inhibit both the rolling (side-to-side) and the pitching (fore-and-aft) actions of the hull.

Fig 14 shows a side-view of a typical boat having a vertical slot 23 running part-way only along the center-line of the hull. In this embodiment the slot 23 is closed at both its fore-end 31 and its aft-end 33, while being completely or intermittently open along its bottom-edge 25. This embodiment preserves maximum structural strength and integrity at both ends of the hull while sacrificing some performance through the reduced length of the slot 23.

Fig 15 shows an alternative embodiment of the partial-slot 23 of Fig 14. In this embodiment the slot fore-end 31 remains closed while the slot aft-end 33 is open.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

This embodiment maximizes the hull strength and integrity at its forward end where it is most vulnerable.

Fig 16 shows an underside view of a typical boat hull incorporating a single, angled, transverse slot 23. The transverse slot 23 generates two COB's 21 longitudinally distanced from each other along the longitudinal centre-line of the hull. This transverse slot 23 would minimize the pitching (fore-and-aft) action of hull.

ADDITIONAL and ALTERNATIVE EMBODIMENTS

Given the great variety of boat and/or hull types that are in common use, the designation of a single preferred embodiment of the invention is not considered to be appropriate. Singular or combined embodiments of the alternatives shown or described or anticipated by the drawings and descriptions herein presented, will be found appropriate to most individual boat/hull types in common use.

Manufacturing and Use

The straightforward simplicity of the functional element-- a slot through-along or through-across, a boat hull--provides for utmost simplicity of construction.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

Essentially all that is required is a fabricated or molded hollow trunk which would create and enclose the slot. This could quite easily be fabricated by a boat-builder of basic skill and using any of the common boat-building materials: wood/steel/aluminum/composites/etc, or a combination of any of these materials.

The engineering design demands are minimal as adding a rigid structural member to the inside of a hull would inherently enhance the stiffness and strength of the combined structure. At best the trunk could be fully integrated to the longitudinal and transverse structural framing members of the hull and so significantly enhance the structural stiffness and strength of the combined structure and so enable weight-savings in the fabrication of other components of the complete boat. This integration of the structural framework could also be used to advantage in designing in structural/watertight bulkheads; watertight compartments; flotation chambers; crash compartments; etc.

Among the specific considerations in design and manufacturing are: (A) Where transverse slots are employed, these slots should be fully or in most part closed along their

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

undersides. This is in recognition of the significant weakening of the hull structure, and of the significant disruption of streamlined water-flow, which would result from a substantially open-bottom transverse slot.

- B) For the dictates of aesthetics, the slot may be configured to fall entirely below the hull water-line in the hull designed full-loaded condition. This however would preclude the increasing effectiveness of the slot in conditions where the boat is loaded in excess of its designed full-load.
- C) Creation of an open slot through the submerged portion of a boat hull would clearly result in a reduction in flotation (buoyancy) of the hull in the extent of the volume of the submerged portion of the slot. Given that the slot is designed to be relatively narrow, this loss of floatation volume should be of little significance when spread over the total volume of the submerged portion of the hull.
- D) Of *prima facie* concern must be the not insignificant increase in wetted-surface presented by the side-walls of a slot. There is some trade-off in this against the direct resistance that would be offered by a contoured hull stem-section in lieu of an open fore-end of a slot.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

This limitation is largely eliminated in embodiments incorporating closed fore-ends of the slots as in Figs 14 and 15. In the case of slots with open fore-ends, this limitation may be substantially mitigated by the installation of a contoured deflector-cap spaced a very short distance in front of the open fore-end of the slot.

E) There is also the inconvenience of a slot-trunk which intrudes into the accommodation spaces of a boat. This would be an unavoidable cost of the substantial benefits to be derived from the invention and the boat-builder would need to design around this intrusion in the layout of the accommodation plan for the boat.

In operation and use, it is not anticipated that the introduction of narrow slot(s) to a hull would result in any significant changes in the boat-handling and so no new skills or techniques in boat-operation would become necessary.

In the context that a more stable; more safe in operation; and more comfortable boat would substantially reduce operator and occupant fatigue and discomfort, a boat

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

incorporating this Slotted Hull invention should provide for more comfortable, more confident and less stressful operation and use.

It is evident then that the herein disclosed invention of the Slotted Hull provides several significant described, illustrated and anticipated advantages over conventional hulls in common use.

Advantages

From the description and illustrations presented herein, a number of advantages of the disclosed Slotted Hull invention become evident: -

The Slotted Hull employs relatively narrow vertical slots, running along the length and /or across the width, and principally below the water-line of a boat hull, to separate the water displaced by the hull into two or more separate "bodies-of-buoyancy" each one generating its own Centre of Buoyancy (COB). These multiple created COB's act as multiple "feet" on which the boat hull "stands" in the water and which substantially inhibit the rolling and/or pitching actions to which conventional hulls are susceptible, and further:-

- a) provide a boat hull of significantly enhanced inherent stability over traditional

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

boat hulls;

- b) provide a boat hull that will be safer in use and operation than traditional boat hulls;
- c) provide a boat hull which will accord a significantly increased level of comfort and well-being to its occupants.
- d) provide a boat hull which retains favoured aesthetics while providing the substantial benefits of enhanced stability, enhanced safety and enhanced comfort.
- e) provide a boat hull with the enhancing benefits listed to d) above, without the introduction of substantial additional weight to the hull.
- f) provide a boat hull with the enhancing benefits listed to d) above, without significant increase to the power-requirements for propelling the hull.
- g) provide a boat hull with the enhancing benefits listed to d) above, without any significant increase to the draft of the hull.
- h) provide a boat hull with the enhancing benefits listed to d) above, without significant increase to the wetted-surface/drag of the hull.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

- i) provide a boat hull which delivers the enhancing benefits listed to d) above, for which benefits, the enabling structure enhances the inherent strength, stiffness and integrity of the basic hull.
- j) provide a boat hull which delivers the enhancing benefits listed to d) above in entirely passive manner, without the introduction of any articulating mechanical or powered devices.
- k) provide a boat hull which delivers the enhancing benefits listed to d) above, without requiring appendages external to the hull.
- l) provide a boat hull which delivers the enhancing benefits listed to d) above, without any requirement for alteration of the basic external dimensions of the boat/hull.
- m) provide a boat hull which delivers the enhancing benefits listed to d) above and which is adaptable to most, and possibly all, common hull configurations.
- n) provide a boat hull which delivers the enhancing benefits listed to d) above and is easy and uncomplicated to manufacture.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

- o) provide a boat hull which delivers the enhancing benefits listed to d) above and which may readily be manufactured using any of the common boat-building materials
- p) provide a boat hull which delivers the enhancing benefits listed to d) above without substantial increase in construction cost; and possibly with reduced construction cost versus alternative systems of stabilization.
- q) provide a boat hull which delivers the enhancing benefits listed to d) above and which would require no new skills or techniques for its operation and use; and which, by its reduction in user/operator fatigue, would enhance the comfort and well-being of its occupants.
- r) provide a boat hull which delivers the enhancing benefits listed to d) above, and which would satisfy the requirements of the various regulatory/certifying agencies.

Conclusion, Ramifications and Scope

Accordingly the reader will see that the Slotted Hull of this invention presents boat hulls which retain popular aesthetics and handling characteristics and further provide enhanced stability, safety and comfort.

The Slotted Hull incorporates relatively narrow, vertical slots running longitudinally and/or transversely through the hull of the boat. The slots are positioned principally below the water-line of the hull and their effect is to separate the supporting water into effectively separate and distinct "bodies-of-buoyancy" each of which would generate its own Centre of Buoyancy (COB). This multiplicity of COB's, each falling at some distance from any other generates a multiplicity of effective "feet" on which the hull "stands" in the water, in contrast to the single COB of conventional hulls, the single COB being a single virtual pivot-point around/about which a hull tends to rotate/see-saw in rolling/pitching action.

The multiplicity of 'spread-apart feet' of the Slotted Hull of this invention would impart greatly enhanced stability, safety and comfort levels to the hull and commensurately enhance the operation and use experience. This is accomplished in a manner that is elegant in concept and design; simple, uncomplicated and inexpensive

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

in manufacture; has minimal maintenance requirements; and is passive, straightforward and intuitive in operation and use.

Although the description above contains many specificities these should not be construed as limiting the scope of the invention but as merely providing illustrations of some of the presently preferred embodiments of this invention. For example, slots incorporated to boat hulls may: -

- incorporate contoured 'lips' wherever an edge of a slot interfaces with the water;
- incorporate side-walls that are not perfectly vertical to the hull;
- incorporate side-walls that are not perfectly parallel to each other;
- incorporate top and bottom edges that are not perfectly horizontal to the hull;
- incorporate top and bottom edges that are not perfectly parallel to each other;
- be fitted with screens or solid closures to inhibit ingress to marine organisms;
- be fitted with deflector appendages for the regulation and control of water-flow into, through, across or around the slot;
- etc.

Thus the scope of the invention should be determined by the appended claims and their legal equivalents, rather than by the examples given.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

CLAIMS

I claim:

1. A hull of a boat incorporating at least one more or less vertical slot extending longitudinally and/or transversely partly or completely through said hull and extending to below the waterline of said hull.

- Other claims to follow.

Provisional Patent Application

Of Buddie Gordon Miller

For SLOTTED HULL

ABSTRACT

A boat hull providing substantially enhanced stability, safety and comfort over conventional boat hulls in common use; incorporating at least one relatively narrow, more-or-less vertical slot (23) running longitudinally and/or laterally through the hull of the boat and positioned so that the slot(s) (23) intersects a major portion of the depth of the water displaced by the boat hull.

The slot (s) (23) may be fully or partially closed at any of its fore-end (31) or aft-end (33) or bottom-edge (25).
